

**The Chemours Company Completes Installation of Carbon Adsorption Units**  
*Immediate Action Taken as Part of Over \$100 Million Commitment  
to Address Emissions in North Carolina*

**Wilmington, Del.**, May 29, 2018 – The Chemours Company (Chemours) (NYSE: CC), a global chemistry company with leading market positions in titanium technologies, fluoroproducts and chemical solutions, announced today that carbon adsorption bed technology has been successfully installed at two key locations on its Fayetteville Works plant in Fayetteville, North Carolina.

The fully operating carbon adsorption beds are designed to remove air emissions of C3 dimer acid (also referred to as GenX). Installation of this state-of-the-art technology is immediately providing a significant reduction in C3 dimer acid air emissions.

“I am personally committed to ensuring our Fayetteville Works plant responds to the concerns of our neighbors,” said Brian Long, Fayetteville Works Plant Manager. “I am confident our scientists and engineers have developed short and long-term solutions which will reduce our environmental footprint and make this plant a leader in the chemical industry.”

In addition to the carbon adsorption beds, Chemours is also investing in emission control technology which will reduce the majority of C3 dimer acid emissions by the end of this year, including upgrades to a waste gas scrubber that will be completed in October. This work is part of a commitment to spend over \$100 million at the Fayetteville Works facility to make it a best-in-class facility with respect to air and wastewater emission control and a model for other chemical manufacturing facilities around the globe.
